

## Beautiful Soup

---

Most webpages are crowded with many elements. But when performing a web scrape, you likely want to scrape only a subset of the elements from each page. And, you can do so by using Beautiful Soup! Beautiful Soup is a Python library that allows you to pull out and parse specific information from a webpage. You first use Splinter to visit a webpage and then use Beautiful Soup to extract the information that you want.

---

### Install Beautiful Soup

In your terminal in your active coding environment, run the `pip install bs4` command.
